

# Maintenance in China 2017 Survey Report

Does maintenance  
play a role in  
the China Dream?

Follow us on Wechat

In partnership with:

# Executive summary

---

The “Maintenance in China” 2017 survey gives a snapshot of the evolving maintenance management practices of industrial companies in the era of the “China Dream”.

Responses show **great awareness of maintenance**, more particularly **among Chinese infrastructures and utilities**, with **risk prevention as a key driver**.

**Execution however is still lagging: decision support is a weak area**, making it difficult to close the “feedback loop” as per the ISO 55000 (or GB/T 33172) Asset Management standard.

**Most companies are considering improvement actions** that could help address those concerns.

The survey shows that **best performers:**

- Have a maintenance strategy
- See maintenance as risk prevention
- Have a CMMS (81% of local respondents do not)
- Hold regular meetings...
- ... during which historical records are analyzed

# The 2017 survey

# The 2017 Maintenance in China survey

---

Launched in 2008 and now in its 5th edition, the “Maintenance in China” survey is a joint project between the Sino-European School of Technology of Shanghai University (UTSEUS) and Siveco China, the country’s largest maintenance consultancy. It is by far the most comprehensive survey of its kind.

[www.utseus.com](http://www.utseus.com)

[www.sivecochina.com](http://www.sivecochina.com)

A benchmarking opportunity for companies operating industrial assets in China, this year’s survey also offers interesting insights in the changing role of maintenance, long underestimated, as the country enters a new phase of its industrial development, moving up in the value chain, with increasing automation, robotization and focus on sustainable development, embodied in such concepts as the China Dream and Made in China 2025.

# Respondents

---

**493**

**Respondents**

**Representing**  
**453**  
**Companies**

## **Located all over China**

The previous edition of this survey, in 2013, had 834 respondents but ran for a much longer period of time (8 months vs. 2 months this year). The well-established Business Confidence Survey of the EUCCC (European Chamber of Commerce in China) offers a good point of comparison, with 506 respondents in 2016.

Responses were well-distributed across all provincial-level divisions of China, with the exception of Tibet. Less than 10 responses in total came from Hongkong, Macau and Taiwan. A few responses from outside of China were excluded from this analysis.

# The questionnaire

---

The questionnaire was aligned with the

# ISO 55000:2014

family of Asset Management standards,  
now also available as Chinese standard\*

# GB/T33172-2016

Questions covered:

- **Maintenance strategy & business impact**
- **Execution and supporting tools** (staffing, training, preventive maintenance, relations with production, spare parts, subcontracting, documentation, IT tools)
- **Decision support & improvement**

\* Approved by the Standard Administration of the People's Republic of China (SAC) on October 13, 2016, effective from May 1, 2017 under the names:

GB/T 33172-2016 资产管理, 综述、原则和术语

GB/T 33173-2016 资产管理, 管理体系 要求

GB/T 33174-2016 资产管理, 管理体系 GB/T 33173 应用指南

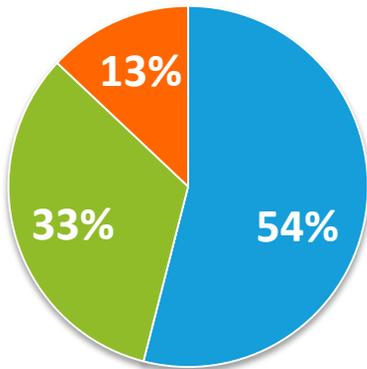

---

# Survey responses

# Respondents profile

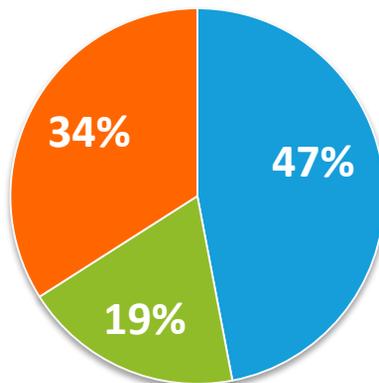

---

## Industry

- Infrastructures and utilities
- Process manufacturers
- Discrete manufacturers & others

## Nationality

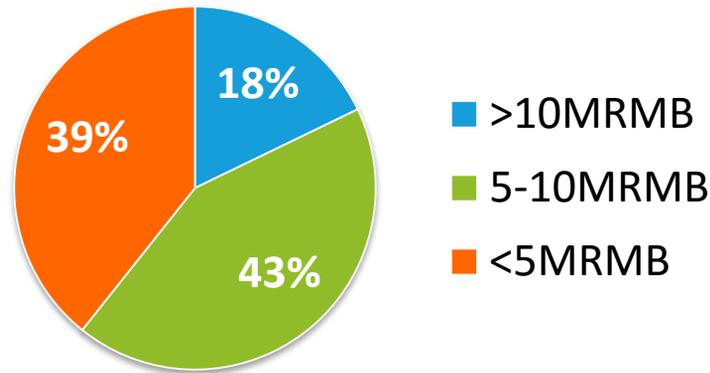

- Chinese
- Joint ventures
- International

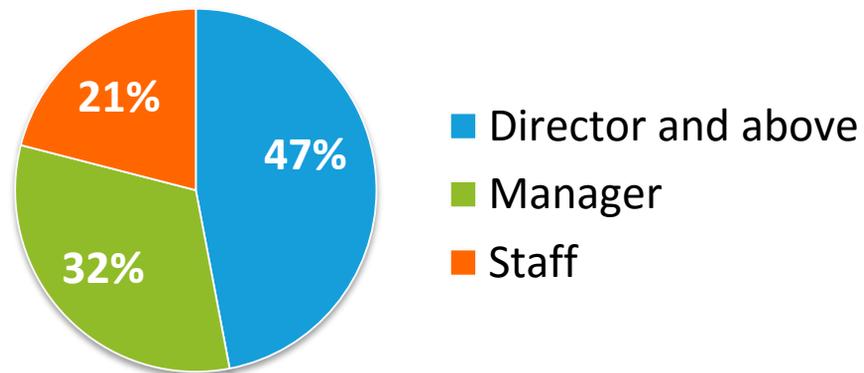

The survey was dominated by Chinese companies and joint-ventures, unlike previous editions (84% multinationals in 2013). Most local respondents are infrastructures & utilities, most international companies are manufacturers. Comparison of response rates (vs. mailing lists) shows a relative lack of interest from multinationals (international chambers were also less interested in the survey compared to 2013).

---

## Annual maintenance budget

## Seniority level

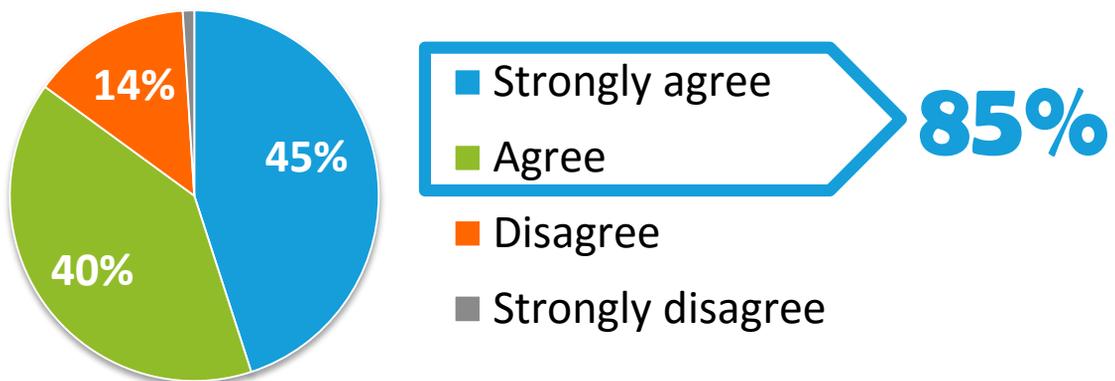

Size comparison shows most respondents were mid-size or large companies (more than 5 RMB annual maintenance budget).

The survey attracted a senior management audience, reflecting interest on the topic of maintenance at management level.

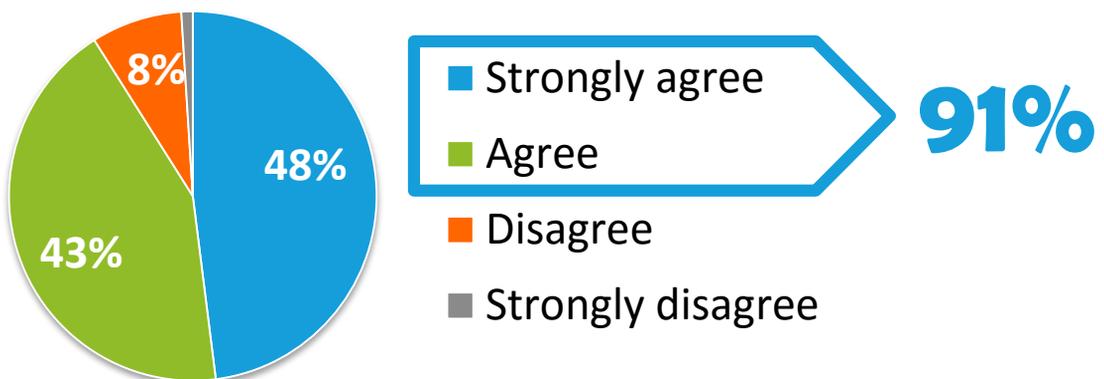

## Maintenance strategy

---

**The maintenance strategy is established, documented and known to all stakeholders**

**The maintenance strategy is aligned with the company's overall strategy**

The surprisingly positive responses on strategy-related questions show great awareness of the importance of maintenance, which was far from being the case in previous surveys. Wishful thinking or reflection of a changing reality?

## Business impact

---

**A significant<sup>1</sup> share of our equipment is in poor condition that could result in disruptions**

(1) More than 5%

**44%**

**A significant<sup>2</sup> share of our production losses are due to breakdowns**

(2) More than 10%

**21%**

**26% Do Not Know**

**A significant<sup>3</sup> share of failures results in production losses**

(3) More than 5%

**23%**

Responses show that maintenance has a significant business impact, which perhaps partly explains the higher awareness at top management levels.

# Staffing

---

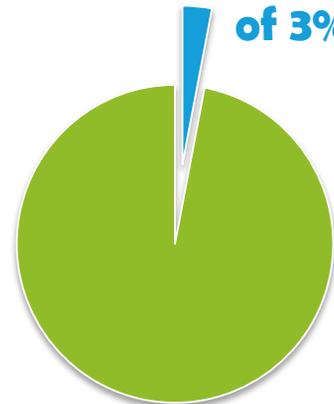

## Process industry, infrastructures & utilities

**10-25% with  
an average  
of 13%**

## Discrete manufacturing

**1-5% with an  
average  
of 3%**

■ Maintenance  
■ Others

**Nobody is in charge of  
maintenance planning**

**5%**

Staffing figures are in line with international standards (in 2013 companies surveyed were considered slightly understaffed in maintenance).

# Training

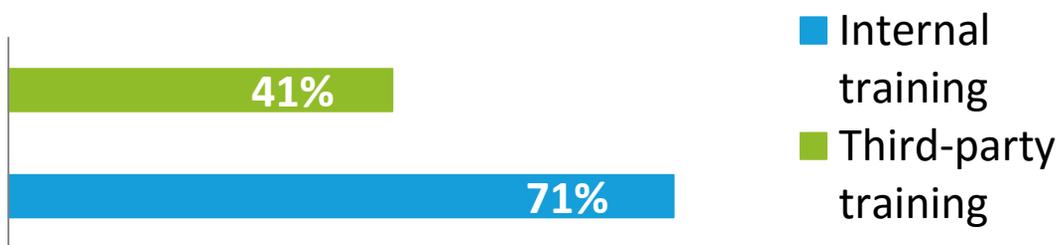

---

Has your team been trained on maintenance management and methodologies?

**Yes**  
**46%**

**No**  
**54%**

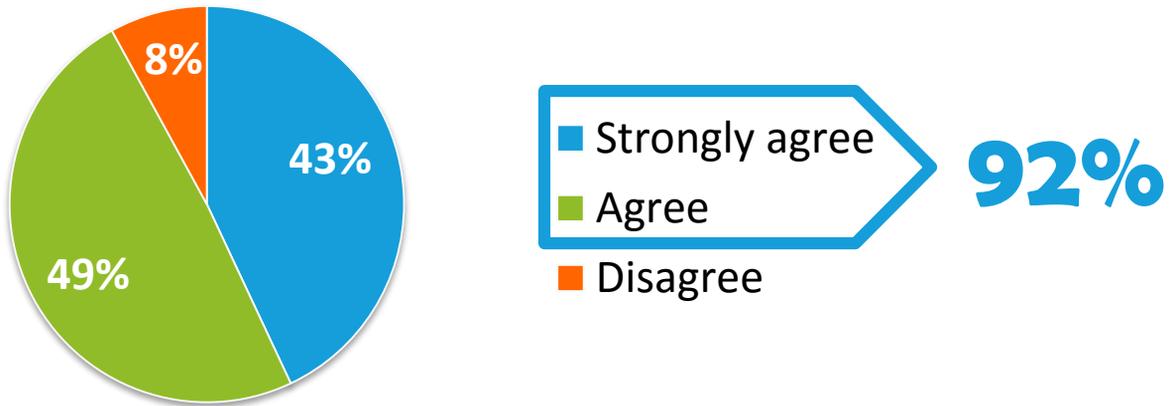

## Maintenance training received

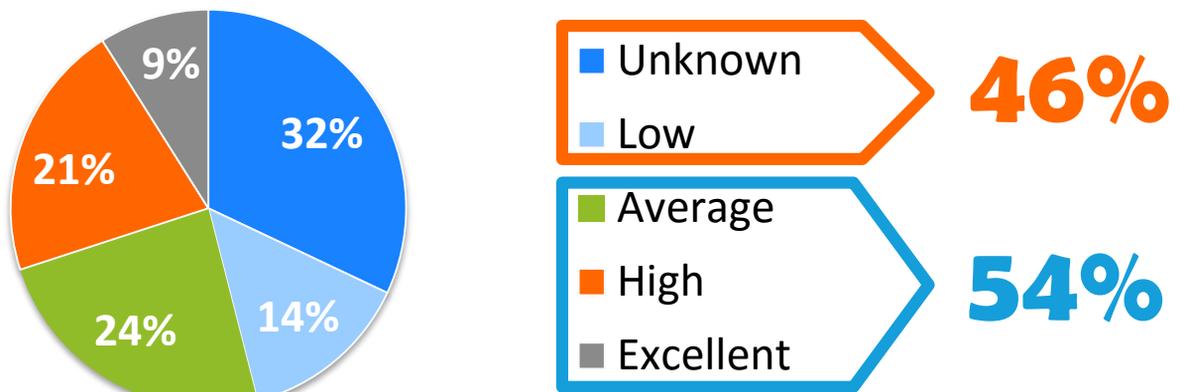

In contrast with extremely positive responses on maintenance strategy, 54% of maintenance teams have not received training on maintenance management and methodologies: who, then, develops and implements the strategy?

# Preventive maintenance

## Preventive maintenance plans are in place for all critical assets

## Share of preventive actions in overall maintenance

Low <25%, average 25-50%, high < 85%, excellent >85%

Responses on the existence of preventive maintenance plans are again overwhelmingly positive. The preventive maintenance ratio is reversed (improved) compared to 2013, but for 46% of respondents preventive maintenance remains insufficient.

## Relations with production

---

**Preventive  
maintenance stops are  
coordinated with  
production**

**80%**

**6% No Plan**

**The production department  
is satisfied with  
maintenance stoppages**

**66%**

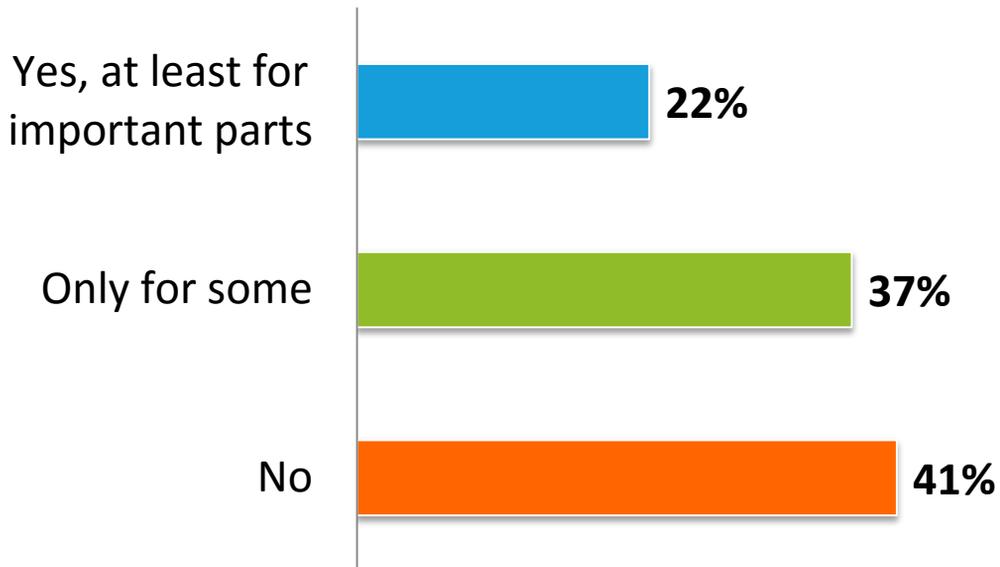

**34% Not  
Satisfied**

Overall relationship between maintenance and production (operation) departments is good.

## Spare parts

---

### Do you know the turnover rate of your spare parts stock?

### Are the parts needed available in stock?

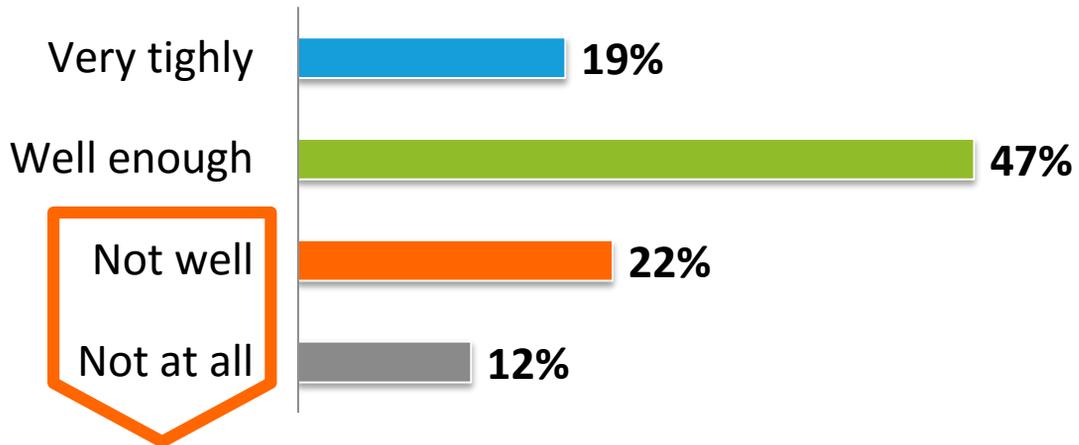

**33% Do Not Know**

**25% say less than 1/10th are in stock**

Spare parts-related questions show major improvement opportunities. Less than one fourth of respondents know the turnover rate of important spare parts. One third do not know if the parts they need are in stock.

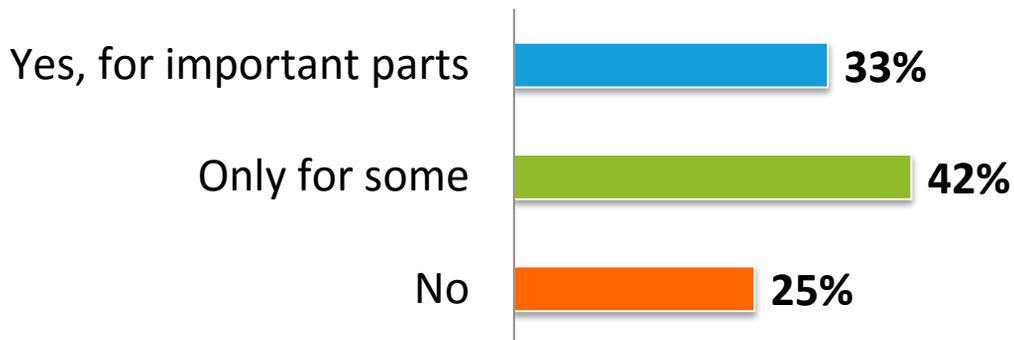

---

## How do you control the origin and quality of spare parts?

**34%**

## Have you already performed an optimization of your stock?

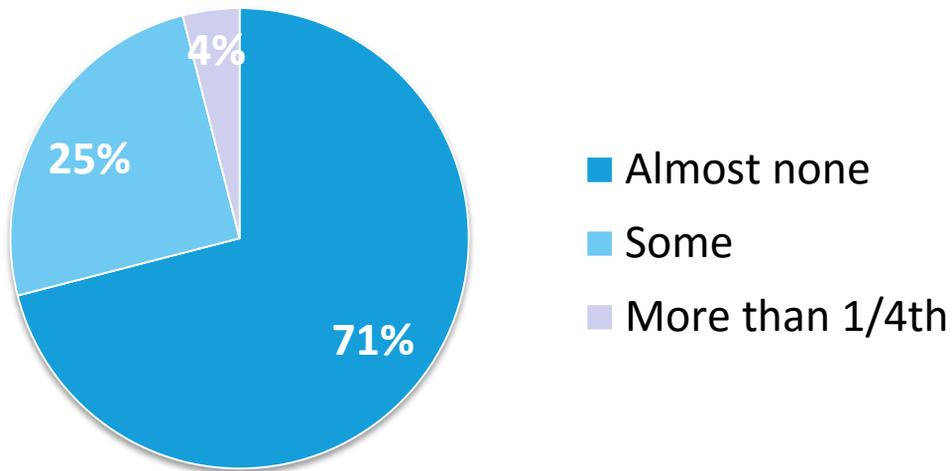

Similarly, responses show the origin and quality of parts are not under control. Only one third of respondents have optimized their stock for important parts.

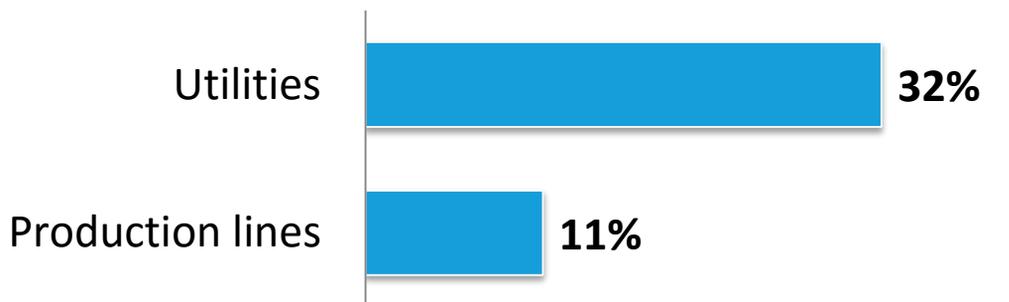

# Subcontracting

---

## How much maintenance do you subcontract?

## What maintenance is outsourced?

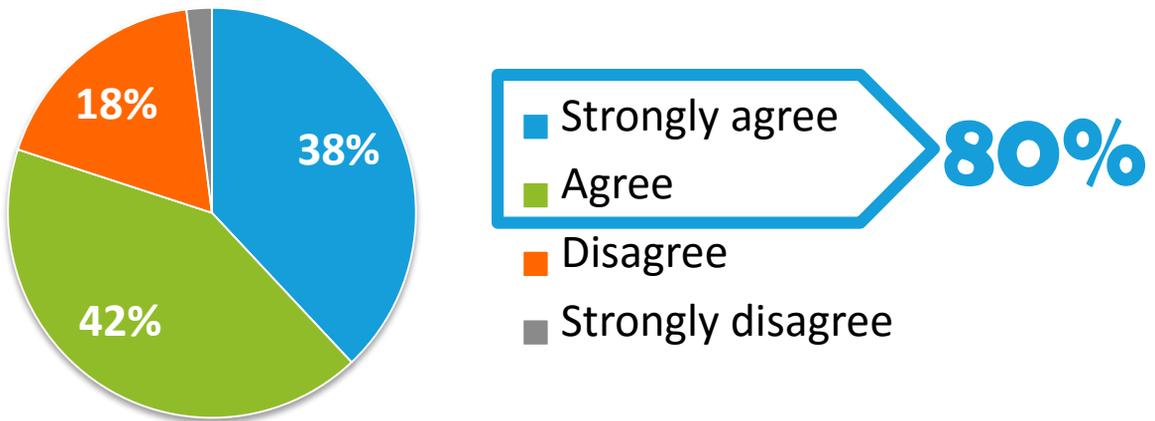

Outsourcing is still uncommon. There are no good or bad answers to outsourcing questions. Outsourcing of utility maintenance (non-core for manufacturers) is an example of strategic approach to maintenance.

# Documentation

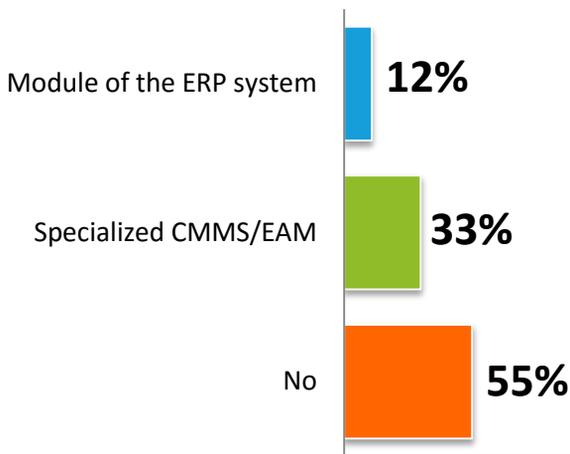

---

**Technical documentation is complete and up-to-date for all critical assets**

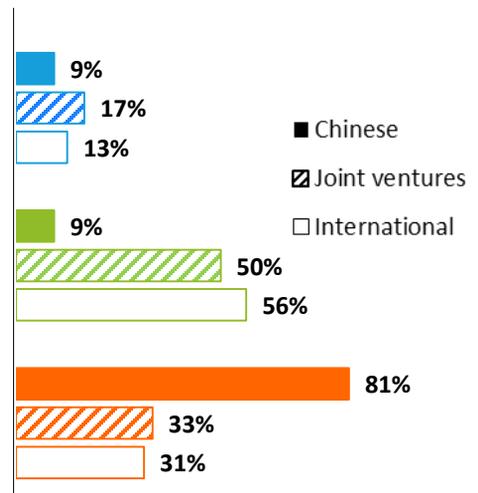

# IT tools

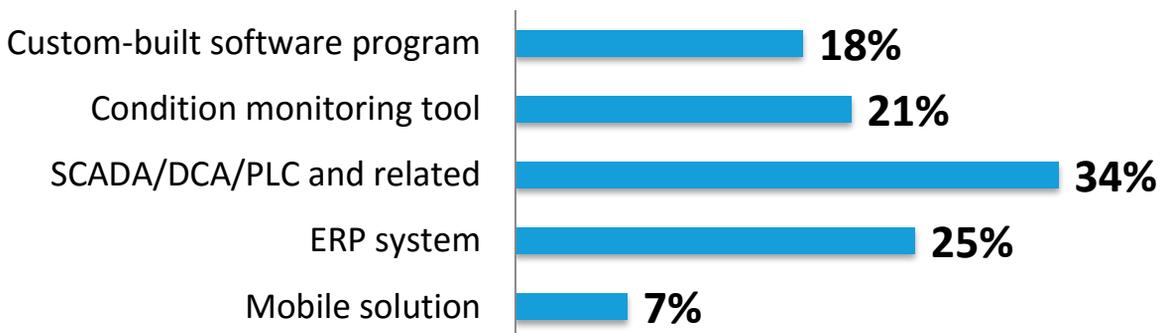

## Is your company using a computerized maintenance management system?

## Major differences between nationality / industry

## What other IT tools are you using for maintenance ?

Over half of respondents (and over 80% of local firms, most of them infrastructures or utilities) do not use a CMMS. For multinationals, comparison with 2013 results show that CMMS adoption rate has increased (from 60 to 70%).

## Decision support

---

Maintenance improvement meetings are held regularly

**85%**

... during which historical records are analyzed

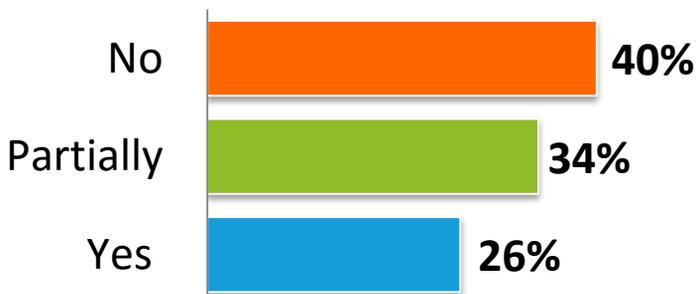

**23% always**

**31% sometimes**

**46% no**

Are records useful for management decisions?

Clearly defined maintenance KPIs

**74%**

... but KPIs not useful

**66%**

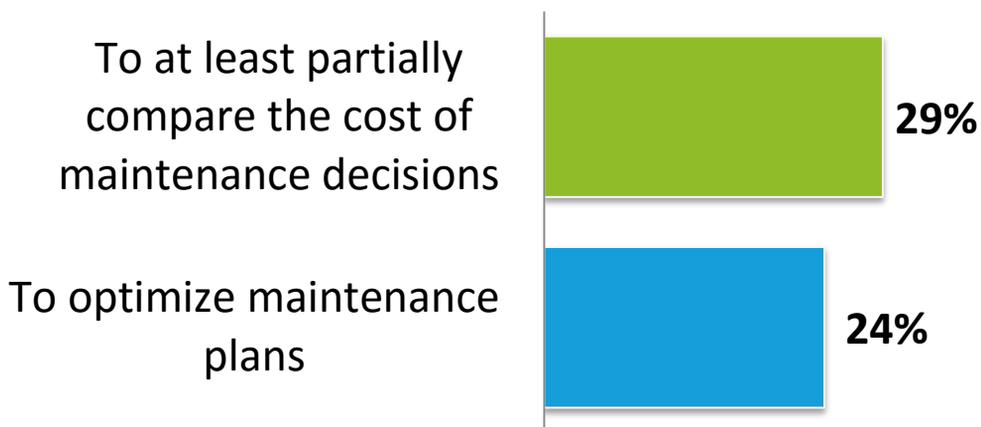

Responses show that when maintenance management controls and tools have been put in place, they seldom produce the expected effects in terms of decision support.

---

Failures are reported and analyzed **87%**

Do you know your equipment failure rate?  
**19% for all**  
**35% for important ones**  
**54% no**

### Analysis of records allows

The same discrepancy is seen for failure analysis: experience shows that companies perform individual failure analysis but do not aggregate data over time.

# Improvement

---

**A significant<sup>1</sup> number of  
breakdowns could be  
prevented**

**81%**

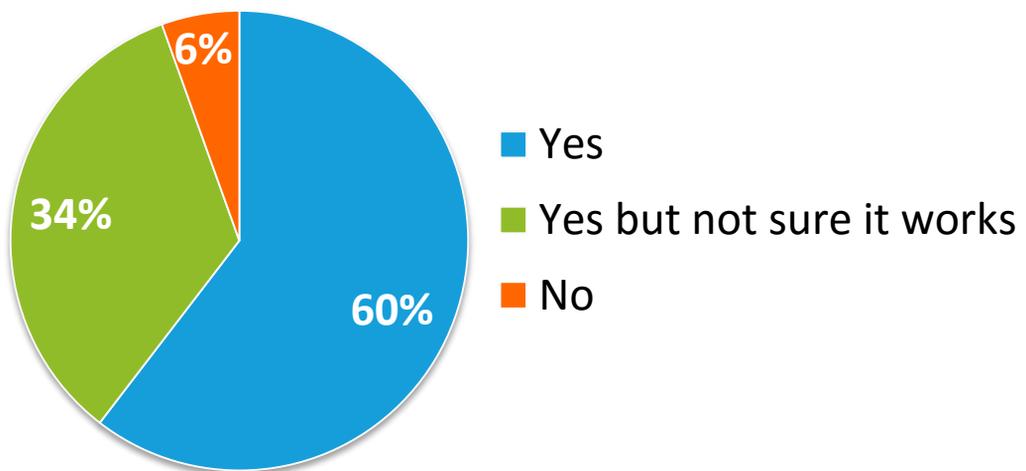

(1) More than 5%

**Major<sup>2</sup> productivity gains could be  
achieved through preventive  
maintenance**

**55%**

(2) More than 10%

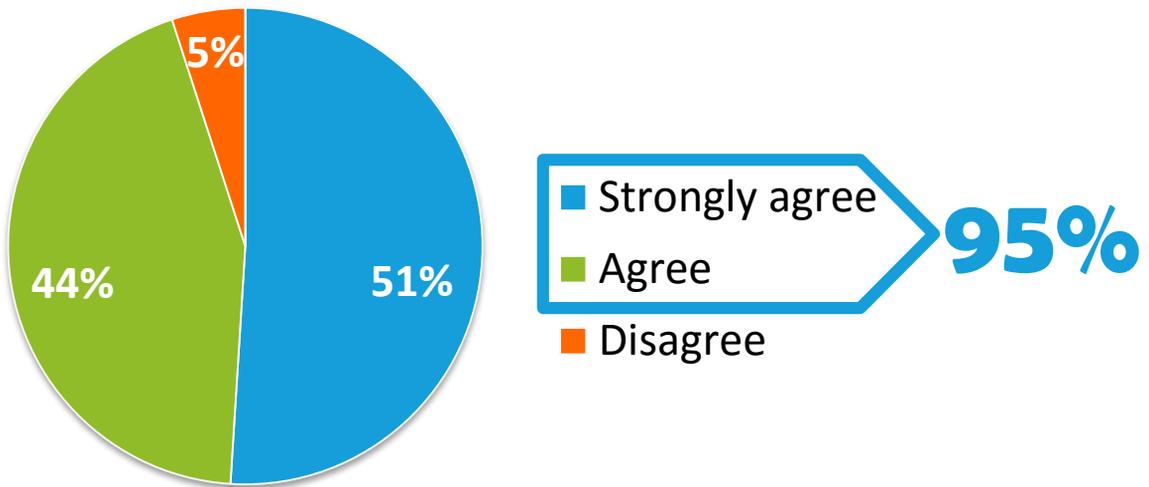

## **Plan to reduce operation cost through maintenance**

Significant improvement potential exists in terms of breakdowns prevention and productivity gains. 94% of respondents plan to reduce operation cost through maintenance.

---

## We see maintenance as industrial risk management

**We pay more attention to maintenance than before**

**94%**

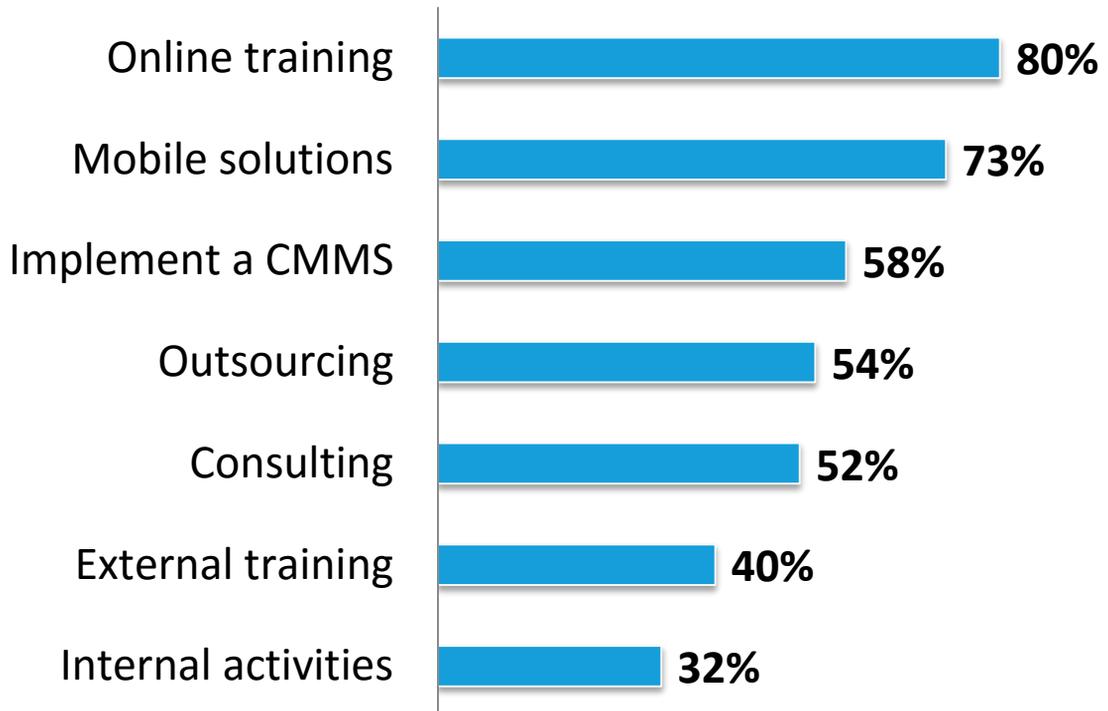

### **Why? Top 5 keywords in comments:**

- 1. life cycle cost**
- 2. aging equipment,**
- 3. shareholder risks,**
- 4. increase profit,**
- 5. safety requirements**

Massively positive responses again about the importance of maintenance. 94% declared paying more attention to maintenance (up from 72% in 2013). 26% of respondents offered comments, the top five keywords are shown above.

---

## How do you plan to improve maintenance?

**68%**

**plan to  
use  
CAPEX**

Improvement plans often include a range of simultaneous actions. Using CAPEX (investment) is consistent with the goal of reducing risk (rather than OPEX to reduce cost). In 2013, only 47% planned to use CAPEX (the trend at that time was to run smaller OPEX projects aimed at cost reduction).

---

# Conclusions

## Executive summary

---

**We observe much greater awareness of maintenance among respondents, with risk prevention as a key driver.**

**Execution however is still lagging: decision support is a weak area, making it difficult to close the ISO 55000 (or GB/T 33172) “feedback loop”.**

**Most companies are considering improvement actions that could help address those concerns.**

## Greater awareness

---

**We observe much greater awareness of maintenance among respondents, with risk prevention as a key driver.**

- **High response rate by local firms** (mostly infrastructure and utilities), with 94% of respondents that declare paying more attention than before to maintenance.
- Very high rate (over 85%) of **positive statements about maintenance strategy** (an essential part of ISO 55000 or GB/T 33172).
- **95% see maintenance as risk prevention**, confirmed by comments. Production improvement is only a secondary driver.

## Execution is lagging

---

### Execution however is still lagging.

- **54% of maintenance teams have not been trained on the necessary management concept and methodologies**, making it hard to define and implement the strategy.
- For a comparatively large share of respondents (almost 50%), **preventive maintenance remains insufficient**.
- For one third of respondents, **spare parts management appears weak**, with a lack of knowledge, control and under-optimization.

## Weak feedback loop

---

**Decision support is a weak area, making it difficult to close the ISO 55000 (or GB/T 33172) “feedback loop”.**

- If maintenance management controls and tools have been put in place, they seldom produce the expected effects in terms of decision support: 85% analyze failure records, run regular meetings, 45% already use a CMMS... yet less than 50% know their failure rate, less than 30% are able to compare costs and optimize maintenance plans, only 25% can use records for decisions... Similarly 76% have KPIs, yet 66% do not find them useful.

**Most companies are considering improvement actions that could help address those concerns.**

- Internal activities
- External training
- Implement a CMMS

# Influence of nationality & industry

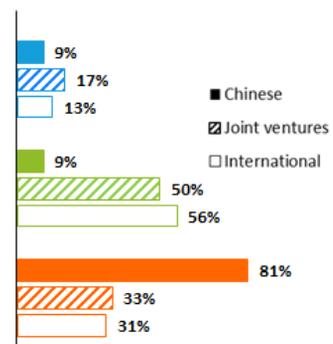

---

In this survey, most local respondents are infrastructure & utilities, while most multinationals are manufacturers, thus differences may reflect industry practices rather than national practices.

The only significant differences found are:

- **Higher response rate from Chinese infrastructure & utility companies, showing stronger interest on the topic of maintenance from local firms.**
- **Lower penetration of CMMS technology among local firms: 81% of Chinese infrastructure & utility companies are not using a CMMS vs. 31% for international manufacturing companies.**

**Major differences between nationality / industry**

# What about the Chinese Dream?

We believe and observe that the increasing awareness of maintenance among Chinese infrastructure & utilities firms comes from:

- Government push for sustainable development
- Strict HSE regulatory enforcement
- Promotion of computerization (“4.0”)

bluebee® cloud helps multisite organizations manage their Assets, Facilities, Field Service and Risk Prevention in line with international standards (ISO 55000, ISO 31000).

**bluebee® cloud**

bluebee® is a unique tool designed “for the worker of tomorrow” to capture information from the field and to enforce systematic recording of failures, non-compliances and work done. bluebee® also integrates with IoT and control systems.

**bluebee® mobile and tablet**

Coswin 8i is a Computerized Maintenance Management System and Enterprise Asset Management solution designed to help companies increase their profitability while ensuring regulatory compliance.

**Coswin**

---

# Recommendations

## What do “best in class” companies do?

---

Our analysis team could not identify simple correlations between one single factor (CMMS, strategy, etc.) and good performance (high positive response rates related to production impact and spare parts management).

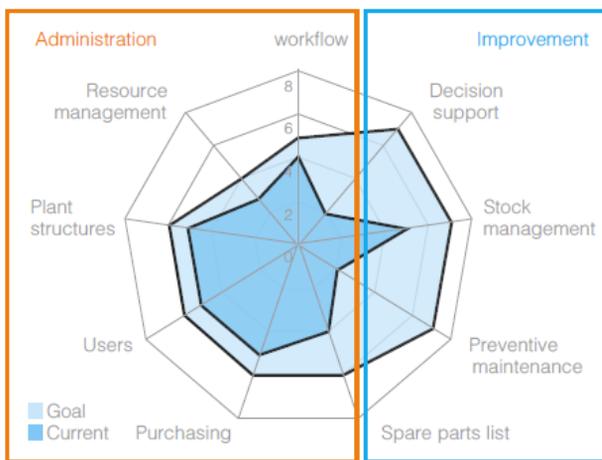

**However, companies with the best performance:**

- **Have a maintenance strategy**
- **See maintenance as risk prevention**
- **Have a CMMS**
- **Hold regular meetings...**
- **... during which historical records are analyzed**

# Factors in closing the “feedback loop”

Responses from “best in class” companies show that having a CMMS is a key factor. Indeed, for large companies such as our respondents, the amount and complexity of historical data are such that manual processing is not possible. The CMMS also helps manage the entire project.

However, responses also show that the CMMS alone is not enough. Based on Siveco’s experience, key steps are often missing: implementation not aligned with strategy, no standardization of codes, no actionable KPIs, no coaching of the team, no taking of “Chinese characteristics” into account.

IT focus i.e. focus on what IT people know (typical “EAM”)

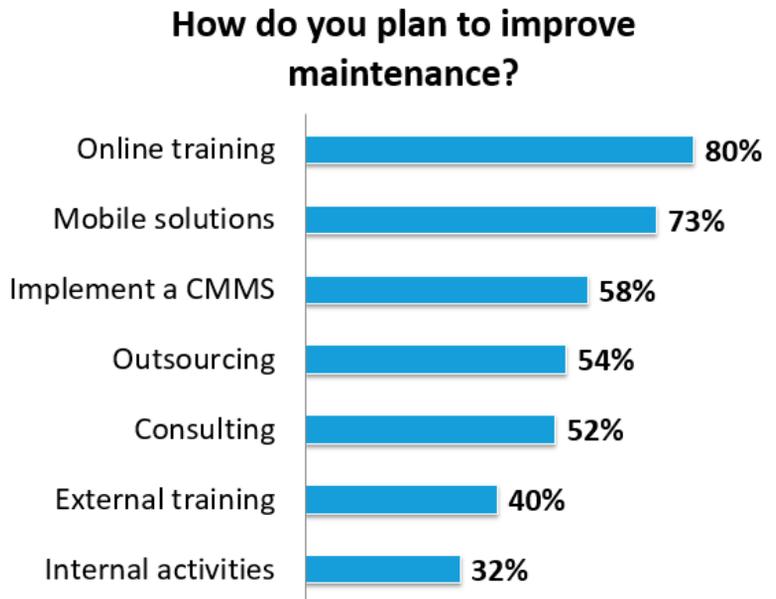

Study of Maximo data over a 3 year period

**Other studies show that CMMS projects in China tend to be driven by IT, with no positive impact on business.**

---

**The CMMS project can then be used as a “catalyst” to incorporate all activities:**

**For such a project, ISO 55002:2014 (or GB/T 33174-2016), Section 6.2.2.1 offers useful advice:**

There can be benefits in developing the first asset management plan(s) as an interim plan as quickly as possible, using existing information. It helps the organization to understand the strengths and weaknesses of current asset management practices and to identify priorities for the development of future plan(s). It can also help avoid embarking on ambitious data collection exercises before needs are fully understood.

# Acknowledgments

---

The joint UTSEUS & Siveco China survey team would like to thank all respondents. We also thank the French Chamber of Commerce and Industry in China (CCIFC) and all associations that have kindly helped distribute the questionnaire.

## Welcome to Maintenance 4.0

Based on a long experience of “maintenance with Chinese characteristics”, Siveco has developed a unique approach combining maintenance consulting and software tools. While the Chinese market has historically been plagued by IT suppliers without understanding of industrial reality, Siveco is run by maintenance people for maintenance people, focusing on obtaining rapid and sustainable improvement.
